

Flint Hills: Soils and Great Groups

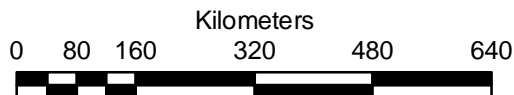

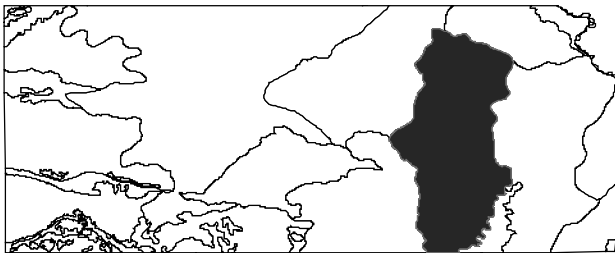

The entire Flint Hills data set is complete for SSURGO, however certain SCD data, that data which includes several of the chemical properties, is missing for some areas. Surrogates will be chosen to address the missing standard soil series.

Other missing data includes "Great Groups" of soils, or, more specifically Aquents, Aquolls, Arents, Fluvaquents, Fluvents, Orthents, and Orthents, are much less easy to determine a surrogate for, as these are mixes of many soils in areas where differentiation is impossible. These are shown in YELLOW on the map.
